Instruction Sheet

Subject: CleanAir Pack

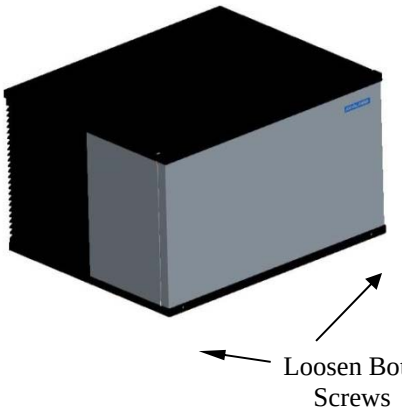

INSTALLATION INSTRUCTIONS

Slime is a leading cause of ice machine breakdowns, and biological growth is a health concern. The CleanAir Pack® system releases chlorine dioxide on a controlled basis to inhibit the growth of bacteria and fungi that form slime and cause malodors in the food zone of ice machines. The CleanAir Pack® will not control mineral or other water borne buildup. Your water quality will determine the length of time before mineral buildup affects ice machine performance. Mineral buildup must be removed as often as necessary to ensure trouble-free operation of the ice machine.

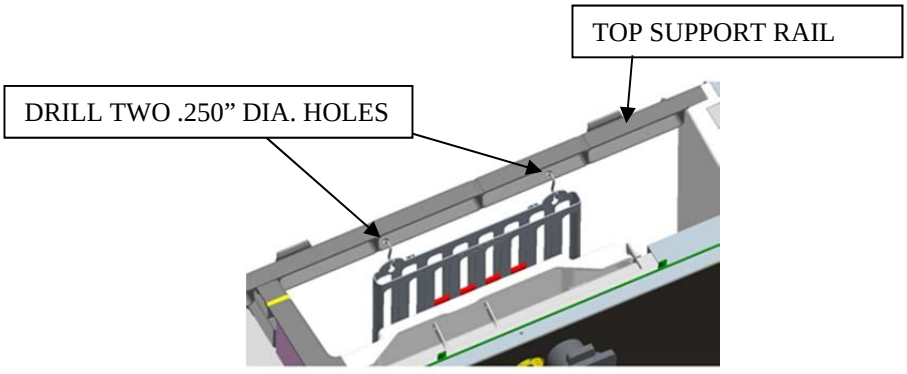

INSTALLATION

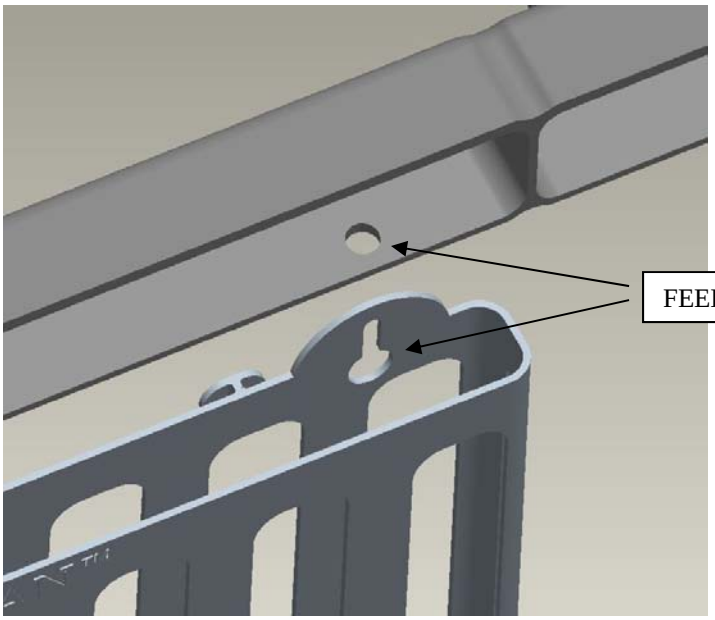

A sachet holder is included with these sachet packets; install the sachet holder in the inside of food zone by hanging from machine top rail, if one is not already present.

1. Loosen both front panel screws and lift off front door.

2. Drill two .250” holes in underside of top support rail 8” apart. Be careful to avoid internal ribbed area on top rail.

3. Attach sachet holder using keyway slots to top rail drilled holes with provided removable cable ties.
4. Remove the new sachet packet from the foil package and install into holder. Removing the foil package allows moisture in the air to activate the sachet contents.
5. Reattach front panel and tighten screws.
